#### Chapter 4 Network Layer: The Data Plane

#### A note on the use of these Powerpoint slides:

We're making these slides freely available to all (faculty, students, readers). They're in PowerPoint form so you see the animations; and can add, modify, and delete slides (including this one) and slide content to suit your needs. They obviously represent a *lot* of work on our part. In return for use, we only ask the following:

- If you use these slides (e.g., in a class) that you mention their source (after all, we' d like people to use our book!)
- If you post any slides on a www site, that you note that they are adapted from (or perhaps identical to) our slides, and note our copyright of this material.

Thanks and enjoy! JFK/KWR

#### Computer Networking

*Computer Networking: A Top Down Approach* 

7<sup>th</sup> edition Jim Kurose, Keith Ross Pearson/Addison Wesley April 2016

# Chapter 4: outline

- 4.1 Overview of Network layer
  - data plane
  - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
  - datagram format
  - fragmentation
  - IPv4 addressing
  - network address translation
  - IPv6

4.4 Generalized Forward and SDN

- match
- action
- OpenFlow examples of match-plus-action in action

# IP addressing: CIDR

CIDR: Classless InterDomain Routing

- subnet portion of address of arbitrary length
- address format: a.b.c.d/x, where x is # bits in subnet portion of address

#### IP addresses: how to get one?

Q: How does a host get IP address?

- hard-coded by system admin in a file
  - Windows: control-panel->network->configuration->tcp/ ip->properties
  - UNIX: /etc/rc.config
- DHCP: Dynamic Host Configuration Protocol: dynamically get address from as server
  - "plug-and-play"

#### DHCP: Dynamic Host Configuration Protocol

goal: allow host to dynamically obtain its IP address from network server when it joins network

- can renew its lease on address in use
- allows reuse of addresses (only hold address while connected/"on")
- support for mobile users who want to join network (more shortly)

DHCP overview:

- host broadcasts "DHCP discover" msg [optional]
- DHCP server responds with "DHCP offer" msg [optional]
- host requests IP address: "DHCP request" msg
- DHCP server sends address: "DHCP ack" msg

#### DHCP client-server scenario

### **DHCP client-server scenario**

## **DHCP: more than IP addresses**

DHCP can return more than just allocated IP address on subnet:

- address of first-hop router for client
- name and IP address of DNS sever
- network mask (indicating network versus host portion of address)

#### DHCP: example

- connecting laptop needs its IP address, addr of first-hop router, addr of DNS server: use DHCP
- DHCP request encapsulated in UDP, encapsulated in IP, encapsulated in 802. I Ethernet
- Ethernet frame broadcast (dest: FFFFFFFFFF) on LAN, received at router running DHCP server
- Ethernet demuxed to IP demuxed, UDP demuxed to DHCP

#### **DHCP:** example

- DCP server formulates DHCP ACK containing client's IP address, IP address of first-hop router for client, name & IP address of DNS server
- encapsulation of DHCP server, frame forwarded to client, demuxing up to DHCP at client
- client now knows its IP address, name and IP address of DSN server, IP address of its first-hop router

#### DHCP: Wireshark output (home LAN)

Message type: Boot Reguest (1) Hardware type: Ethernet Hardware address length: 6 request Hops: 0 Transaction ID: 0x6b3a11b7 Seconds elapsed: 0 Bootp flags: 0x0000 (Unicast) Client IP address: 0.0.0.0 (0.0.0.0) Your (client) IP address: 0.0.0.0 (0.0.0.0) Next server IP address: 0.0.0.0 (0.0.0.0) Relay agent IP address: 0.0.0.0 (0.0.0.0) Client MAC address: Wistron\_23:68:8a (00:16:d3:23:68:8a) Server host name not given Boot file name not given Magic cookie: (OK) Option: (t=53,l=1) DHCP Message Type = DHCP Request Option: (61) Client identifier Length: 7: Value: 010016D323688A; Hardware type: Ethernet Client MAC address: Wistron 23:68:8a (00:16:d3:23:68:8a) Option: (t=50,I=4) Requested IP Address = 192.168.1.101 Option: (t=12,I=5) Host Name = "nomad" **Option: (55) Parameter Request List** Length: 11; Value: 010F03062C2E2F1F21F92B 1 = Subnet Mask; 15 = Domain Name 3 = Router: 6 = Domain Name Server 44 = NetBIOS over TCP/IP Name Server

#### IP addresses: how to get one?

Q: how does *network* get subnet part of IP addr?A: gets allocated portion of its provider ISP's address space

ISP's block	<u>11001000</u>	00010111	00010000	00000000	200.23.16.0/20
Organization 0	11001000	00010111	00010000	00000000	200.23.16.0/23
Organization 1	11001000	00010111	00010010	00000000	200.23.18.0/23
Organization 2	11001000	00010111	<u>0001010</u> 0	00000000	200.23.20.0/23
Organization 7	11001000	00010111	00011110	00000000	200.23.30.0/23

#### Hierarchical addressing: route aggregation

hierarchical addressing allows efficient advertisement of routing information:

#### Hierarchical addressing: more specific routes

#### ISPs-R-Us has a more specific route to Organization I

#### IP addressing: the last word...

Q: how does an ISP get block of addresses?

A: ICANN: Internet Corporation for Assigned

Names and Numbers http://www.icann.org/

- allocates addresses
- manages DNS
- assigns domain names, resolves disputes

all datagrams leaving local network have same single source NAT IP address: 138.76.29.7,different source port numbers datagrams with source or destination in this network have 10.0.0/24 address for source, destination (as usual)

*motivation*: local network uses just one IP address as far as outside world is concerned:

- range of addresses not needed from ISP: just one IP address for all devices
- can change addresses of devices in local network without notifying outside world
- can change ISP without changing addresses of devices in local network
- devices inside local net not explicitly addressable, visible by outside world (a security plus)

*implementation*: NAT router must:

- outgoing datagrams: replace (source IP address, port #) of every outgoing datagram to (NAT IP address, new port #)
  ... remote clients/servers will respond using (NAT IP address, new port #) as destination addr
- remember (in NAT translation table) every (source IP address, port #) to (NAT IP address, new port #) translation pair
- incoming datagrams: replace (NAT IP address, new port #) in dest fields of every incoming datagram with corresponding (source IP address, port #) stored in NAT table

\* Check out the online interactive exercises for more examples: http://gaia.cs.umass.edu/kurose\_ross/interactive/

- I6-bit port-number field:
  - 60,000 simultaneous connections with a single LAN-side address!
- NAT is controversial:
  - routers should only process up to layer 3
  - address shortage should be solved by IPv6
  - violates end-to-end argument
    - NAT possibility must be taken into account by app designers, e.g., P2P applications
  - NAT traversal: what if client wants to connect to server behind NAT?

# Chapter 4: outline

- 4.1 Overview of Network layer
  - data plane
  - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
  - datagram format
  - fragmentation
  - IPv4 addressing
  - network address translation
  - IPv6

4.4 Generalized Forward and SDN

- match
- action
- OpenFlow examples of match-plus-action in action

### **IPv6:** motivation

- initial motivation: 32-bit address space soon to be completely allocated.
- additional motivation:
  - header format helps speed processing/forwarding
  - header changes to facilitate QoS

#### IPv6 datagram format:

- fixed-length 40 byte header
- no fragmentation allowed

## IPv6 datagram format

priority: identify priority among datagrams in flow flow Label: identify datagrams in same "flow." (concept of "flow" not well defined). next header: identify upper layer protocol for data

ver	pri	flow label							
payload len next hdr hop limit									
source address (128 bits)									
destination address (128 bits)									
data									

32 bits

## Other changes from IPv4

- checksum: removed entirely to reduce processing time at each hop
- options: allowed, but outside of header, indicated by "Next Header" field
- ICMPv6: new version of ICMP
  - additional message types, e.g. "Packet Too Big"
  - multicast group management functions

### Transition from IPv4 to IPv6

- not all routers can be upgraded simultaneously
  - no "flag days"
  - how will network operate with mixed IPv4 and IPv6 routers?
- tunneling: IPv6 datagram carried as payload in IPv4 datagram among IPv4 routers

# Tunneling

## Tunneling

IPv4 tunnel Ε В Α F connecting IPv6 routers logical view: IPv6 IPv6 IPv6 IPv6 В С Ε F Α D physical view: IPv6 IPv6 IPv6 IPv4 IPv4 IPv6 src:B flow: X flow: X src:B src: A src: A dest: E dest: E dest: F dest: F Flow: X Flow: X Src: A Src: A Dest: F Dest: F data data data data A-to-B: E-to-F: B-to-C: B-to-C: IPv6 IPv6 IPv6 inside IPv6 inside IPv4 IPv4 Network Layer: Data Plane 4-27

#### **IPv6:** adoption

- Google: 8% of clients access services via IPv6
- NIST: I/3 of all US government domains are IPv6 capable
- Long (long!) time for deployment, use
  - 20 years and counting!
  - think of application-level changes in last 20 years: WWW, Facebook, streaming media, Skype, ...
  - Why?

# Chapter 4: outline

- 4.1 Overview of Network layer
  - data plane
  - control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
  - datagram format
  - fragmentation
  - IPv4 addressing
  - network address translation
  - IPv6

4.4 Generalized Forward and SDN

- match
- action
- OpenFlow examples of match-plus-action in action

### **Generalized Forwarding and SDN**

Each router contains a *flow table* that is computed and distributed by a *logically centralized* routing controller

#### **OpenFlow data plane abstraction**

- flow: defined by header fields
- generalized forwarding: simple packet-handling rules
  - Pattern: match values in packet header fields
  - Actions: for matched packet: drop, forward, modify, matched packet or send matched packet to controller
  - *Priority*: disambiguate overlapping patterns
  - *Counters:* #bytes and #packets

Flow table in a router (computed and distributed by controller) define router's match+action rules

#### **OpenFlow data plane abstraction**

- flow: defined by header fields
- generalized forwarding: simple packet-handling rules
  - Pattern: match values in packet header fields
  - Actions: for matched packet: drop, forward, modify, matched packet or send matched packet to controller
  - *Priority*: disambiguate overlapping patterns
  - *Counters:* #bytes and #packets

## **OpenFlow: Flow Table Entries**

#### Destination-based forwarding:

Port src dst type ID Src Dst Prot sport dport	Switch	MAC	MAC	Eth	VLAN	IP	IP	IP	ТСР	ТСР	Action
	Port	src	dst	type	ID	Src	Dst	Prot	sport	dport	ACTION

\* \* \* \* \* \* \* 51.6.0.8 \* \* \* \* port6

IP datagrams destined to IP address 51.6.0.8 should be forwarded to router output port 6

#### Firewall:

Switch Port	MA0 src	2	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Forward
*	*	*		*	*	*	*	*	*	22	drop

do not forward (block) all datagrams destined to TCP port 22

Switch Port	MA0 src	2	MAC dst	Eth type	VLAN ID	IP Src	IP Dst	IP Prot	TCP sport	TCP dport	Forward
*	*	*		*	*	128.119.1.1	*	*	*	*	drop
			do	not forv	vard (b	lock) al	ll datag	rams s	ent by l	host 12	8.119.1.

#### Destination-based layer 2 (switch) forwarding:

Switch	MAC	MAC	Eth	VLAN	IP	IP	IP	TCP	TCP	Action
Port	src	dst	type	ID	Src	Dst	Prot	sport	dport	
*	22:A7:23: 11:E1:02	*	*	*	*	*	*	*	*	port3

layer 2 frames from MAC address 22:A7:23:11:E1:02 should be forwarded to output port 6

### **OpenFlow** abstraction

- match+action: unifies different kinds of devices
- Router
  - *match:* longest destination IP prefix
  - action: forward out a link
- Switch
  - *match:* destination MAC address
  - *action:* forward or flood

- Firewall
  - match: IP addresses and TCP/UDP port numbers
  - *action:* permit or deny
- NAT
  - *match:* IP address and port
  - action: rewrite address and port

## Chapter 4: done!

- 4.1 Overview of Network layer: data plane and control plane
- 4.2 What's inside a router
- 4.3 IP: Internet Protocol
  - datagram format
  - fragmentation
  - IPv4 addressing
  - NAT
  - IPv6

- 4.4 Generalized Forward and SDN
  - match plus action
  - OpenFlow example

Question: how do forwarding tables (destination-based forwarding) or flow tables (generalized forwarding) computed? Answer: by the control plane (next chapter)
